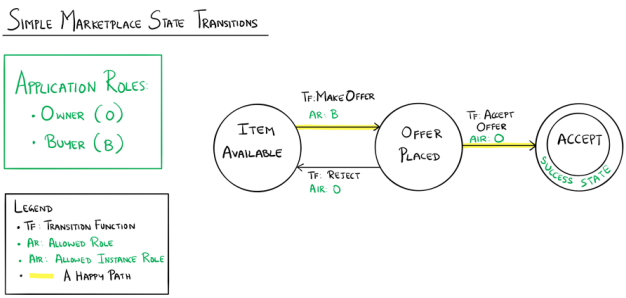
[An inspiring initiative]

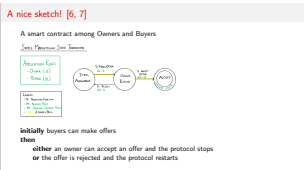
A nice sketch! [6, 7]

A smart contract among Owners and Buyers



initially buyers can make offers
then

either an owner can accept an offer and the protocol stops
or the offer is rejected and the protocol restarts



What did we just see?

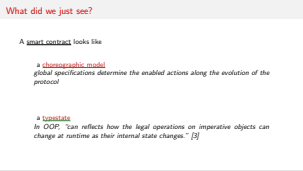
A smart contract looks like

a choreographic model

global specifications determine the enabled actions along the evolution of the protocol

a typestate

In OOP, "can reflects how the legal operations on imperative objects can change at runtime as their internal state changes." [3]



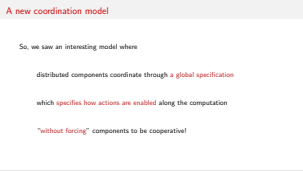
A new coordination model

So, we saw an interesting model where

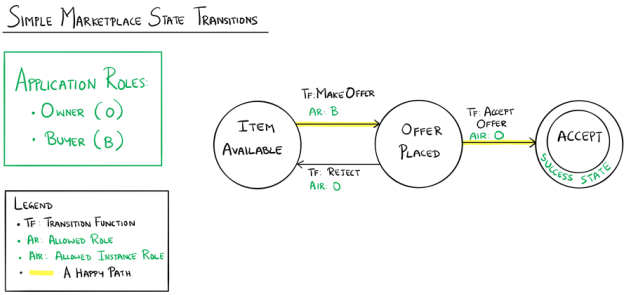
distributed components coordinate through a global specification

which specifies how actions are enabled along the computation

"without forcing" components to be cooperative!



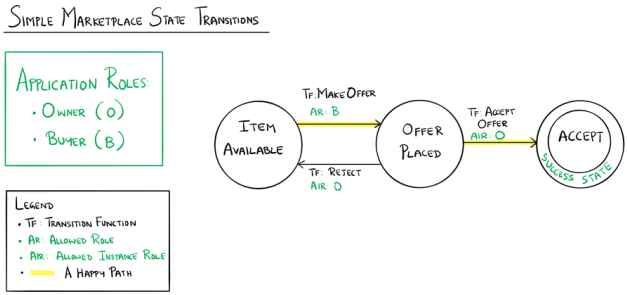
Let's look at our sketch again



Let's look at our sketch again

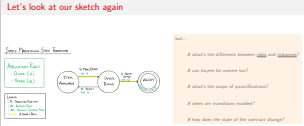
The diagram specifies a lot...

Let's look at our sketch again



but...

- ✗ what's the difference between roles and instances?
- ✗ can buyers be owners too?
- ✗ what's the scope of quantifications?
- ✗ when are transitions enabled?
- ✗ how does the state of the contract change?



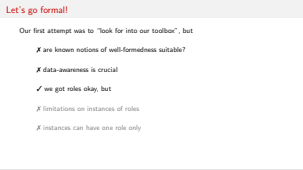
The diagram specifies a lot...

1. is the sketch giving semantics to roles and instances?
2. not forbidden...however what if we wanted to separate the roles?
3. from [7]: "The transitions between the Item Available and the Offer Placed states can continue until the owner is satisfied with the offer made." so, after a rejection, the new offer must be from the original buyer or a new one?
4. ok
5. should the price of the item remain unchanged when the owner rejects offers?

Let's go formal!

Our first attempt was to "look for into our toolbox", but

- ✗ are known notions of well-formedness suitable?
- ✗ data-awareness is crucial
- ✓ we got roles okay, but
- ✗ limitations on instances of roles
- ✗ instances can have one role only



Let's go formal!

Our first attempt was to "look for into our toolbox", but

- ✗ are known notions of well-formedness suitable?
- ✗ data-awareness is crucial
- ✓ we got roles okay, but
- ✗ limitations on instances of roles
- ✗ instances can have one role only

So we had to came up with some new behavioural types.

[A coordination framework]

Basic concepts and notation

Participants $p, p', \ldots$

Basic concepts and notation
Participants $p, p', \ldots$

Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$

Basic concepts and notation
Participants $p, p', \ldots$
have roles $R, R', \ldots$

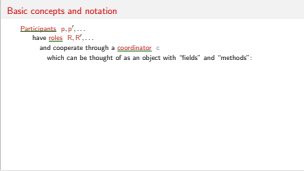
Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c

Basic concepts and notation
Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c

Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c
which can be thought of as an object with "fields" and "methods":

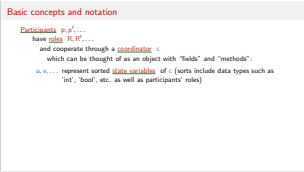


states of the coordinator determine which operations each roles is entitled to invoke

Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c
which can be thought of as an object with "fields" and "methods":

$u, v, \ldots$ represent sorted state variables of c (sorts include data types such as 'int', 'bool', etc. as well as participants' roles)



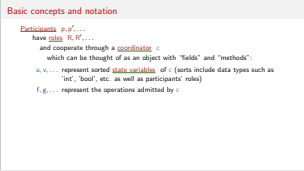
We assume that sorts can be inferred; **TRAC** instead requires to assign sorts explicitly

Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c
which can be thought of as an object with "fields" and "methods":

$u, v, \ldots$ represent sorted state variables of c (sorts include data types such as 'int', 'bool', etc. as well as participants' roles)

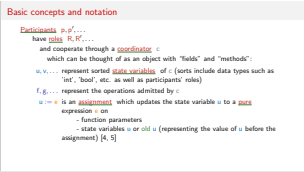
$f, g, \ldots$ represent the operations admitted by c



Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c
which can be thought of as an object with "fields" and "methods":

- $u, v, \ldots$ represent sorted state variables of c (sorts include data types such as 'int', 'bool', etc. as well as participants' roles)
- $f, g, \ldots$ represent the operations admitted by c
- $u := e$ is an assignment which updates the state variable u to a pure expression e on
  - function parameters
  - state variables u or old u (representing the value of u before the assignment) [4, 5]



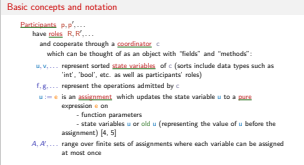
Expressions are standard but for state variables occurring in rhs e must have the old _ qualifier; this concept will be used in the definition of (progress for) well-formedness

We adapt the mechanism based on the old keyword from the Eiffel language [5] which, as explained in [4] is necessary to render assignments into logical formulae since e.g., $x = x+1 \iff$ False.

Basic concepts and notation

Participants $p, p', \ldots$
have roles $R, R', \ldots$
and cooperate through a coordinator c
which can be thought of as an object with "fields" and "methods":

- $u, v, \ldots$ represent sorted state variables of c (sorts include data types such as 'int', 'bool', etc. as well as participants' roles)
- $f, g, \ldots$ represent the operations admitted by c
- $u := e$ is an assignment which updates the state variable u to a pure expression e on
  - function parameters
  - state variables u or old u (representing the value of u before the assignment) [4, 5]
- $A, A', \ldots$ range over finite sets of assignments where each variable can be assigned at most once



Data-Aware FSMs

A DAFSM c on roles $R_1, \ldots R_m$ and state variables $u_1, \ldots, u_n$ is a finite-state machine "instantiated" by a participant p whose transitions are decorated as follows[1]

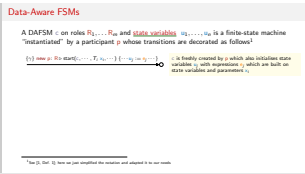
[1] See [1, Def. 1]; here we just simplified the notation and adapted it to our needs

Data-Aware FSMs

A DAFSM c on roles $R_1, \dots R_m$ and state variables $u_1, \dots, u_n$ is a finite-state machine "instantiated" by a participant p whose transitions are decorated as follows[1]

c is freshly created by p which also initialises state variables u_j with expressions e_j which are built on state variables and parameters x_i

[1] See [1, Def. 1]; here we just simplified the notation and adapted it to our needs



start is a "built-in" (and pleonastic) function name

each state variable is declared and initialises with type-consistent expressions on state variables and parameters x_i

Data-Aware FSMs

A DAFSM c on roles $R_1, \dots R_m$ and state variables $u_1, \dots, u_n$ is a finite-state machine "instantiated" by a participant p whose transitions are decorated as follows[1]

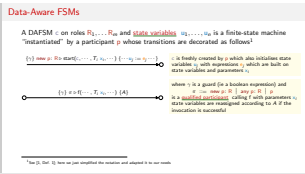
c is freshly created by p which also initialises state variables u_j with expressions e_j which are built on state variables and parameters x_i

where γ is a guard (ie a boolean expression) and

$$\pi \ ::= \ \text{new } p\colon R \ \mid \ \text{any } p\colon R \ \mid \ p$$

is a qualified participant calling f with parameters x_i state variables are reassigned according to A if the invocation is successful

[1] See [1, Def. 1]; here we just simplified the notation and adapted it to our needs



γ

- predicates formal parameters of its transition and over state variables, provided that it not a start transition
- has to be satisfied for the invocation to succeed: an invocation that makes the guard false is rejected

- new p: R specifies that p must be a fresh participant with role R
- any p: R qualifies p as an existing participant with role R
- p refers to a participant in the scope of a binder
- invocations from non-suitable callers are rejected

the variables occurring in the right-hand side of assignments in A are either state variables or parameters of the invocation

Data-Aware FSMs

A DAFSM c on roles $\mathsf{R}_1, \ldots \mathsf{R}_m$ and state variables $\mathsf{u}_1, \ldots, \mathsf{u}_n$ is a finite-state machine "instantiated" by a participant p whose transitions are decorated as follows[1]

c is freshly created by p which also initialises state variables u_j with expressions e_j which are built on state variables and parameters x_i

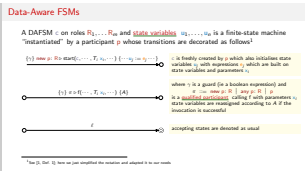
where γ is a guard (ie a boolean expression) and

$$\pi \ ::= \ \mathsf{new}\ \mathsf{p}\colon \mathsf{R} \ \mid \ \mathsf{any}\ \mathsf{p}\colon \mathsf{R} \ \mid \ \mathsf{p}$$

is a qualified participant calling f with parameters x_i state variables are reassigned according to A if the invocation is successful

accepting states are denoted as usual

[1] See [1, Def. 1]; here we just simplified the notation and adapted it to our needs

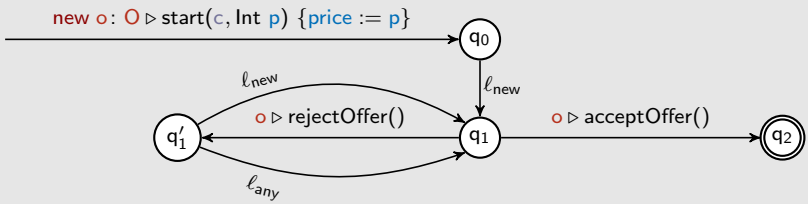


Exercise: modelling

Give a DAFSM for the protocol on slide 7 resolving the ambiguities discussed there.

Exercise: modelling
Give a DAFSM for the protocol on slide 7 resolving the ambiguities discussed there.

Let $\ell_{\text{new}} = \{\text{newOffer} > 0\}$ new b: B ▷ makeOffer(Int newOffer) {offer := newOffer}
and $\ell_{\text{any}} = \{\text{newOffer} > 0\}$ any b: B ▷ makeOffer(Int newOffer) {offer := newOffer}



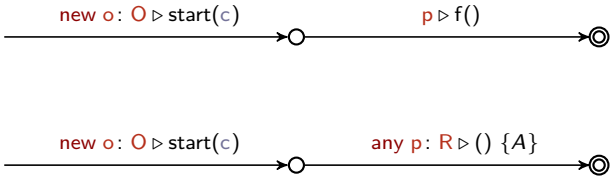
A new participant o acts as owner O for a coordinator c assigning an initial value p to the state variable price in the initial state q_0 where the only enabled function is makeOffer(Int offer). The first buyer b invoking this function with an actual parameter newOffer, satisfying the guard newOffer > 0, moves the protocol to state q_1 while recording the new offer in the coordinator state with the assignment offer := newOffer. Contextually, the state of the coordinator records that the caller b plays role B.

Not all DAFSMs “make sense”

names’ freeness

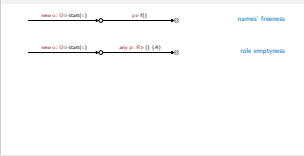
Not all DAFSMs “make sense”
names’ freeness

Not all DAFSMs “make sense”



names’ freeness

role emptyness

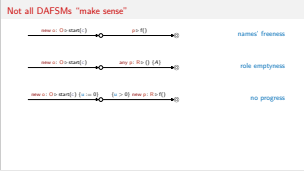


Not all DAFSMs “make sense”

names’ freeness

role emptyness

no progress

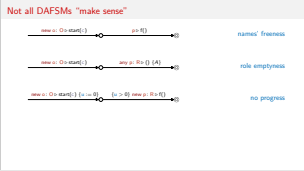


Not all DAFSMs “make sense”

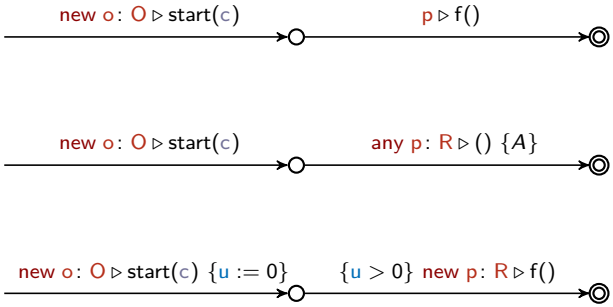
names’ freeness

role emptyness

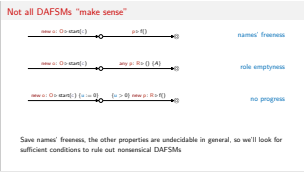
no progress



Not all DAFSMs “make sense”



Save names’ freeness, the other properties are undecidable in general, so we’ll look for sufficient conditions to rule out nonsensical DAFSMs



Closed DAFSMs

Binders: parameter declarations in function calls, new p : R, and any p : R

Closed DAFSMs
Binders: parameter declarations in function calls, new p: R, and any p: R

Closed DAFSMs

Binders: parameter declarations in function calls, new p: R, and any p: R

p is bound in 
if, for some role R,

π = new p: R or π = any p: R or there is i s.t. x_i = p and T_i = R

Closed DAFSMs
Binders: parameter declarations in function calls, new p: R, and any p: R
p is bound in
if, for some role R,
π = new p: R or π = any p: R or there is i s.t. x_i = p and T_i = R

Closed DAFSMs

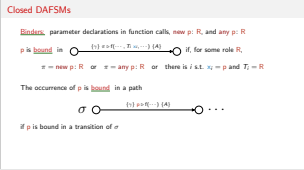
Binders: parameter declarations in function calls, new p : R, and any p : R

p is bound in 
if, for some role R,

π = new p : R or π = any p : R or there is i s.t. x_i = p and T_i = R

The occurrence of p is bound in a path

if p is bound in a transition of σ



Closed DAFSMs

Binders: parameter declarations in function calls, new p: R, and any p: R

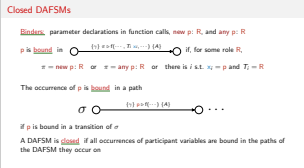
p is bound in 
if, for some role R,

π = new p: R or π = any p: R or there is i s.t. x_i = p and T_i = R

The occurrence of p is bound in a path

if p is bound in a transition of σ

A DAFSM is closed if all occurrences of participant variables are bound in the paths of the DAFSM they occur on



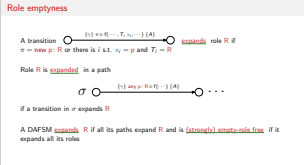
Role emptyness

A transition 
expands role R if
π = new p: R or there is i s.t. x_i = p and T_i = R

Role R is expanded in a path

if a transition in σ expands R

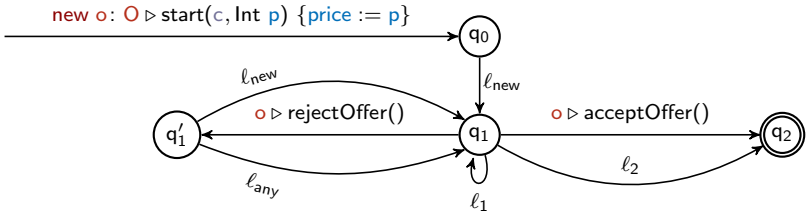
A DAFSM expands R if all its paths expand R and is (strongly) empty-role free if it expands all its roles



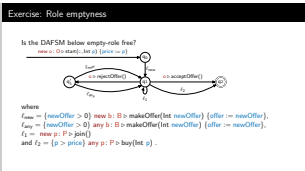
'expands' means register a new participant with that role in the protocol (the participant might already be registered with a different role)

Exercise: Role emptyness

Is the DAFSM below empty-role free?



where
$\ell_{\text{new}} = \{\text{newOffer} > 0\}$ new b: B ▷ makeOffer(Int newOffer) {offer := newOffer},
$\ell_{\text{any}} = \{\text{newOffer} > 0\}$ any b: B ▷ makeOffer(Int newOffer) {offer := newOffer},
$\ell_1 =$ new p: P ▷ join()
and $\ell_2 = \{\text{p} > \text{price}\}$ any p: P ▷ buy(Int p) .



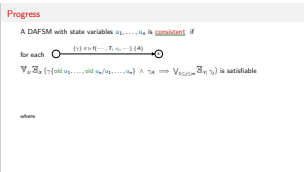
No, because of the paths excluding the self-loop on the role P.
We can fix the problem by adding a parameter of type P to the start transition.

Progress

A DAFSM with state variables $u_1, \ldots, u_n$ is consistent if

for each 
$\mathbb{\forall}_U\, \mathbb{\exists}_X\, (\gamma\{\text{old } u_1, \ldots, \text{old } u_n / u_1, \ldots, u_n\} \ \wedge\ \gamma_A \implies \bigvee_{1 \le j \le m} \mathbb{\exists}_{Y_j}\, \gamma_j)$ is satisfiable

where



for a finite set of symbols Z, $\mathbb{\forall}_Z\,(\_)$ and $\mathbb{\exists}_Z\,(\_)$ are the universal and existential closures of a logical formula on the symbols in Z

Progress

A DAFSM with state variables $u_1, \ldots, u_n$ is consistent if

for each 
$\forall_U \exists_X (\gamma\{\text{old } u_1, \ldots, \text{old } u_n / u_1, \ldots, u_n\} \wedge \gamma_A \implies \bigvee_{1 \le j \le m} \exists_{Y_j} \gamma_j)$ is satisfiable

where

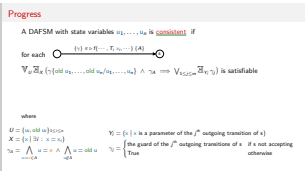
$U = \{u_i, \text{old } u_i\}_{1 \le i \le n}$

$X = \{x \mid \exists i : x = x_i\}$

$\gamma_A = \bigwedge_{u := e \in A} u = e \wedge \bigwedge_{u \notin A} u = \text{old } u$

$Y_j = \{x \mid x \text{ is a parameter of the } j^{\text{th}} \text{ outgoing transition of s}\}$

$\gamma_j = \begin{cases} \text{the guard of the } j^{\text{th}} \text{ outgoing transitions of s} & \text{if s not accepting} \\ \text{True} & \text{otherwise} \end{cases}$



for a finite set of symbols Z, $\forall_Z (\_)$ and $\exists_Z (\_)$ are the universal and existential closures of a logical formula on the symbols in Z

$u \notin A$
iff
for all $v := e \in A$, $u \neq v$ and old u does not occur in e

Progress

A DAFSM with state variables $u_1, \ldots, u_n$ is consistent if

for each $\bigcirc \xrightarrow{\{\gamma\}\ \pi \triangleright f(\cdots, T_i\ x_i, \cdots)\ \{A\}} (s)$

$\forall_U \exists_X (\gamma\{\text{old } u_1, \ldots, \text{old } u_n / u_1, \ldots, u_n\} \wedge \gamma_A \implies \bigvee_{1 \le j \le m} \exists_{Y_j} \gamma_j)$ is satisfiable and

there is $\xrightarrow{\{\gamma\}\ \pi \triangleright \text{start}(\cdots, T_i\ x_i, \cdots)\ \{A\}} (s)$ such that $\exists_X \gamma$ is satisfiable

where

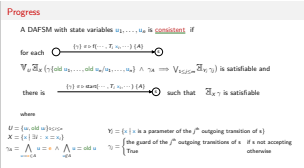
$U = \{u_i, \text{old } u_i\}_{1 \le i \le n}$

$X = \{x \mid \exists i : x = x_i\}$

$\gamma_A = \bigwedge_{u := e \in A} u = e \wedge \bigwedge_{u \notin A} u = \text{old } u$

$Y_j = \{x \mid x \text{ is a parameter of the } j^{\text{th}} \text{ outgoing transition of s}\}$

$\gamma_j = \begin{cases} \text{the guard of the } j^{\text{th}} \text{ outgoing transitions of s} & \text{if s not accepting} \\ \text{True} & \text{otherwise} \end{cases}$

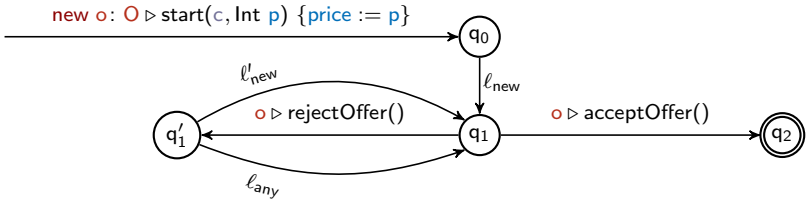


for a finite set of symbols Z, $\forall_Z (\_)$ and $\exists_Z (\_)$ are the universal and existential closures of a logical formula on the symbols in Z

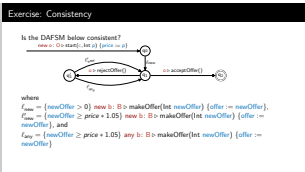
$u \notin A$
iff
for all $v := e \in A$, $u \neq v$ and old u does not occur in e

Exercise: Consistency

Is the DAFSM below consistent?



where
$\ell_{\text{new}} = \{\text{newOffer} > 0\}$ new b: B ▷ makeOffer(Int newOffer) {offer := newOffer},
$\ell'_{\text{new}} = \{\text{newOffer} \geq \textit{price} * 1.05\}$ new b: B ▷ makeOffer(Int newOffer) {offer := newOffer}, and
$\ell_{\text{any}} = \{\text{newOffer} \geq \textit{price} * 1.05\}$ any b: B ▷ makeOffer(Int newOffer) {offer := newOffer}



The DAFSM is consistent.

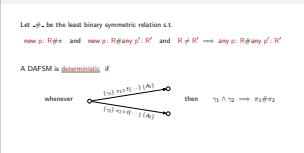
Determinism

Let $\_\#\_$ be the least binary symmetric relation s.t.

$$\text{new } p\colon R\#\pi \quad \text{and} \quad \text{new } p\colon R\#\text{any } p'\colon R' \quad \text{and} \quad R \neq R' \implies \text{any } p\colon R\#\text{any } p'\colon R'$$

A DAFSM is deterministic if

whenever 
then $\gamma_1 \wedge \gamma_2 \implies \pi_1 \# \pi_2$

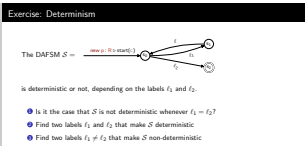


transitions from the same source state and calling the same function

Exercise: Determinism

The DAFSM $\mathcal{S} =$ 
is deterministic or not, depending on the labels ℓ_1 and ℓ_2.

1. Is it the case that $\mathcal{S}$ is not deterministic whenever $\ell_1 = \ell_2$?
2. Find two labels ℓ_1 and ℓ_2 that make $\mathcal{S}$ deterministic
3. Find two labels $\ell_1 \neq \ell_2$ that make $\mathcal{S}$ non-deterministic



1. no: eg for $\ell_1 = \ell_2 =$ new p : R $\mathcal{S}$ is deterministic
2. $\ell_1 = \ell_2 =$ new p : R ▷ f($\cdots$, T_i x_i, $\cdots$) make $\mathcal{S}$ deterministic because the next state is unambiguously determined by the caller which is fresh on both transitions
3. $\ell_1 = \{x \leq 0\}$ p ▷ f(Int x) and $\ell_2 = \{x \geq -1\}$ p ▷ f(Int x) make $\mathcal{S}$ non-deterministic because the guards of ℓ_1 and of ℓ_2 are not disjoint therefore the next state is not determined by the caller

Well-formedness

A DAFSM is well-formed when it is

closed,

empty-role free,

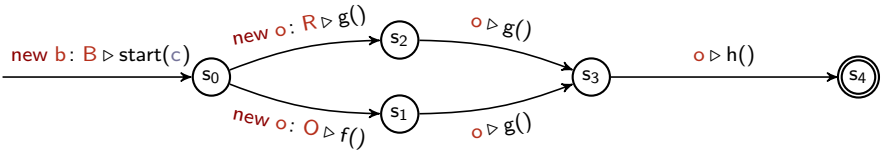
consistent, and

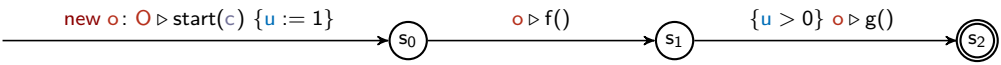
deterministic

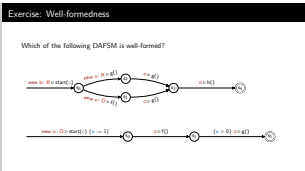
Well-formedness
A DAFSM is well-formed when it is
closed,
empty-role free,
consistent, and
deterministic

Exercise: Well-formedness

Which of the following DAFSM is well-formed?







yes: o is defined on paths it occurs on and the DAFSM is deterministic.

no: the transition from s_0 violates consistency since True does not imply $u > 0$ hinting that the protocol could get stuck in state s_1. However, this never happens because u is initially set to 1 and never changed, hence the transition from s_1 would be enabled when the protocol lands in s_1.

– Act II –

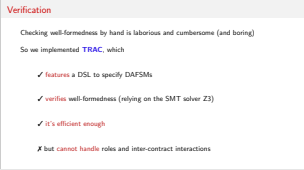
[A tool]

Verification

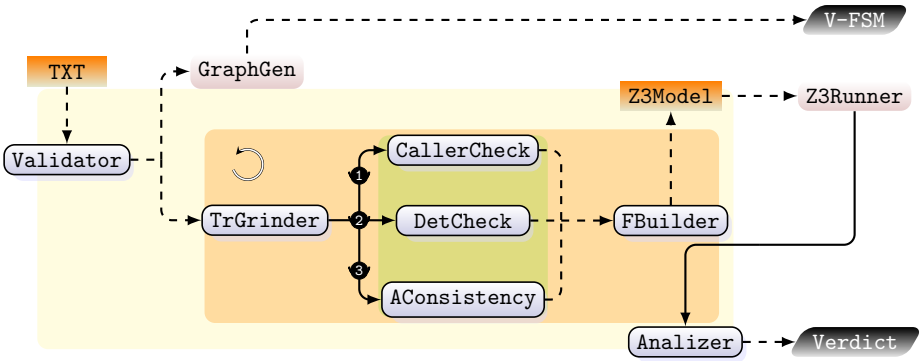
Checking well-formedness by hand is laborious and cumbersome (and boring)

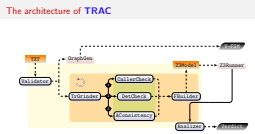
So we implemented **TRAC**, which

- ✓ features a DSL to specify DAFSMs
- ✓ verifies well-formedness (relying on the SMT solver Z3)
- ✓ it's efficient enough
- ✗ but cannot handle roles and inter-contract interactions



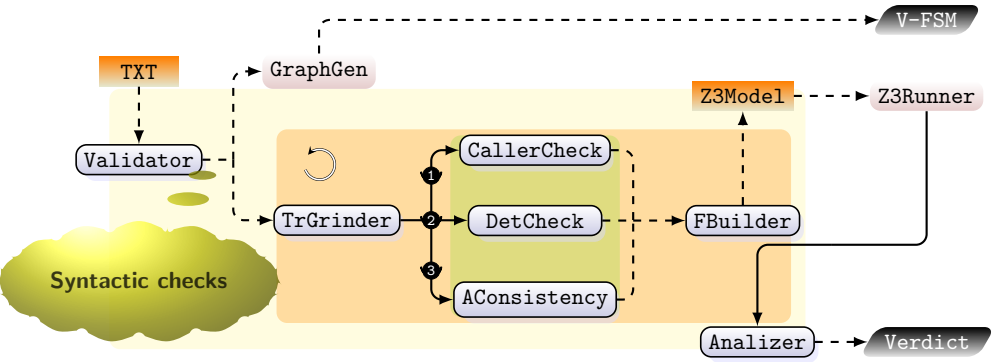
The architecture of **TRAC**

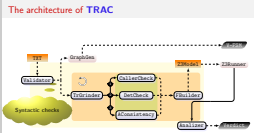




the architecture of **TRAC** is compartmentalised into two principal modules: parsing and visualisation (yellow box) and **TRAC**'s core (orange box). The latter module implements well-formedness check (green box). Solid arrows represent calls between components while dashed arrows data IO.

The architecture of **TRAC**

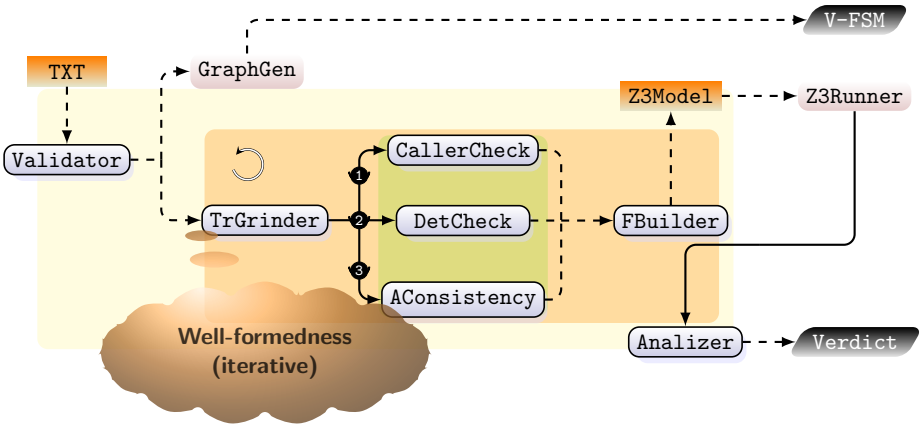


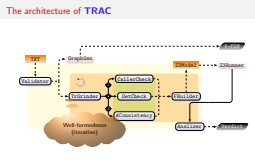


basic syntactic checks on a DSL representation of DAFSMs and transforming the input in a format that simplifies the analysis of the following phases:

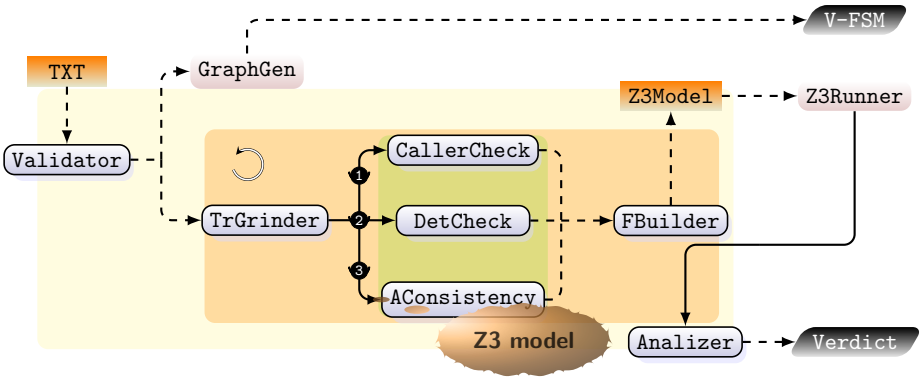
- passed to `GraphGen` for visual representation of DAFSMs (`V-FSM` output)
- passed to the `TrGrinder` component (orange box) for well-formedness checking.

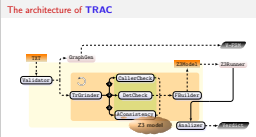
The architecture of **TRAC**





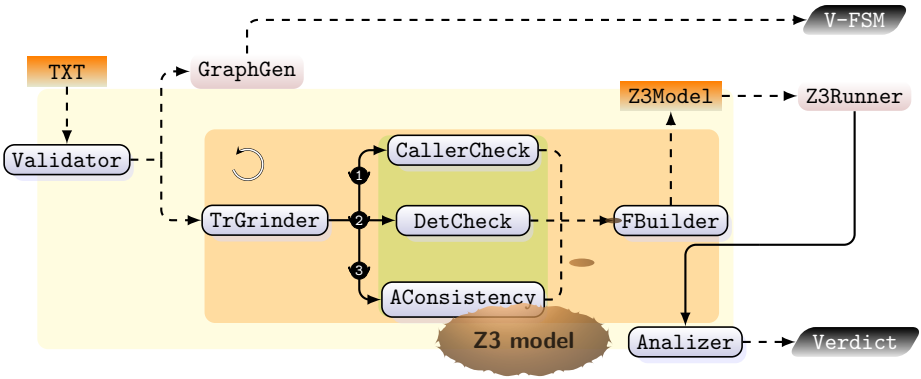
The architecture of **TRAC**

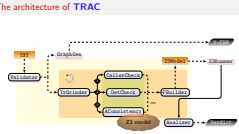




`AConsistency` (arrow ❸) to generate a Z3 formula which holds if, and only if, the transtion is consistent.

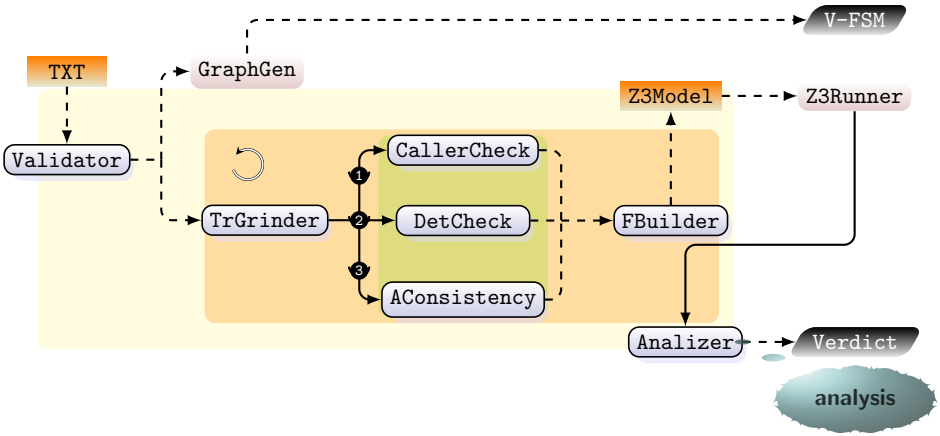
The architecture of **TRAC**

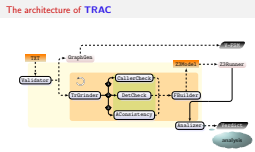




computes the z3 f.la equivalent to the conjunction of the outputs which is then passed to a Z3 engine to check its satisfiability

The architecture of **TRAC**





Finally, the `Analizer` component that diagnoses the output of Z3 and produces a `Verdict` which reports (if any) the violations of well-formedness of the DAFSM in input.

Installation

Detailed instructions at `https://github.com/loctet/TRAC`

Dependencies: Java RE (to render DAFSM graphically) & Python 3.6 or later

```
$ pip install z3-solver matplotlib networkx
```

Concrete syntax (I)

⋮
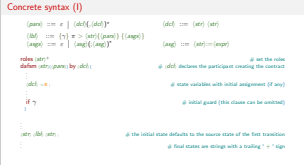
                                                      # final states are strings with a trailing ' + ' sign
```



recall that e and γ are SMT-Lib2 syntax for expressions and boolean expressions respectively

Exercise: TRAC usage (I)

Edit a `.trac` file for the contract specified at
`https://github.com/Azure-Samples/blockchain/blob/master/blockchain-workbench/application-and-smart-contract-samples/basic-provenance/readme.md`

Exercise: TRAC usage (I)
Edit a .trac file for the contract specified at
https:
//github.com/Azure-Samples/blockchain/blob/master/blockchain-workbench/application-and-smart-contract-samples/basic-provenance/readme.md

```
roles Owner Conterparty
dafsm basicProvenance(Owner o) by cp : Conterparty {}
q0 cp > TransferResponsibility(Conterparty cp) {} q1
q1 any cp: Conterparty > TransferResponsibility(Conterparty cp) {} q1
q1 o > Complete() {} q2+
```

Concrete syntax (II)

The syntax of expressions (and hence of guards) follows the SMT-lib standard:

$$
\begin{array}{lcl}
\langle spec\_constant \rangle & ::= & \langle numeral \rangle \mid \langle decimal \rangle \mid \langle hexadecimal \rangle \mid \langle binary \rangle \mid \langle string \rangle \\
\langle s\_expr \rangle & ::= & \langle spec\_constant \rangle \mid \langle symbol \rangle \mid \langle reserved \rangle \mid \langle keyword \rangle \\
 & \mid & \texttt{(} \langle s\_expr \rangle^{*} \texttt{)} \\
\langle qual\_identifier \rangle & ::= & \langle identifier \rangle \mid \texttt{(} \texttt{as} \langle identifier \rangle \langle sort \rangle \texttt{)} \\
\langle var\_binding \rangle & ::= & \texttt{(} \langle symbol \rangle \langle term \rangle \texttt{)} \\
\langle sorted\_var \rangle & ::= & \texttt{(} \langle symbol \rangle \langle sort \rangle \texttt{)} \\
\langle pattern \rangle & ::= & \langle symbol \rangle \mid \texttt{(} \langle symbol \rangle \langle symbol \rangle^{+} \texttt{)} \\
\langle match\_case \rangle & ::= & \texttt{(} \langle pattern \rangle \langle term \rangle \texttt{)} \\
\langle term \rangle & ::= & \langle spec\_constant \rangle \\
 & \mid & \langle qual\_identifier \rangle \\
 & \mid & \texttt{(} \langle qual\_identifier \rangle \langle term \rangle^{+} \texttt{)} \\
 & \mid & \texttt{(} \texttt{let} \texttt{(} \langle var\_binding \rangle^{+} \texttt{)} \langle term \rangle \texttt{)} \\
 & \mid & \texttt{(} \texttt{lambda} \texttt{(} \langle sorted\_var \rangle^{+} \texttt{)} \langle term \rangle \texttt{)} \\
 & \mid & \texttt{(} \texttt{forall} \texttt{(} \langle sorted\_var \rangle^{+} \texttt{)} \langle term \rangle \texttt{)} \\
