

LTL f.l.e implicitly universally quantify on paths

$$s \models \varphi \iff \forall \pi \in \text{Paths}(s). \pi \models \varphi$$

Example: LTL cannot precisely express

"for all computations it is possible φ "

$$\vdash \forall \Box \vdash \exists \Diamond \vdash \varphi$$

$$\text{CTL} = \text{LTL} + \exists \text{ path}$$

(Clarke & Emerson 81,
Awami & Sipakis 82-83)

Natures of (discrete) Time

Syntax

STATE F.L.E

$$\Phi ::= \text{true} \mid \overset{AP}{\omega} \mid \neg \Phi \mid \Phi \wedge \Phi \mid \forall \varphi \mid \exists \varphi$$

path f.l.e

$$\varphi ::= \circ \Phi \mid \Phi \cup \Phi$$

for all paths

for some path

Example Safety

$$\forall \Box (\neg c_1 \vee \neg c_2)$$

$$\forall \Box (\bigwedge_{1 \leq i \neq j \leq n} \neg c_i \vee \neg c_j)$$

Liveness

$$\bigwedge_{1 \leq i \leq n} \forall \Box \forall \Diamond c_i$$

Mutex in CTL

Another CTL liveness f.l.e: $\forall \Box (\text{req} \rightarrow \forall \Diamond \text{res})$

Obs

Temporal operators cannot be immediately preceded by other temporal operators:

- $\exists \Box \Diamond \varphi$ X
- $\exists \Box \forall \Diamond \varphi$ ✓

Also, $\forall (\dots \wedge \dots)$ $\exists \neg \dots$ are not legal!
