[An inspiring initiative]

A nice sketch! [5, 6]

A smart contract among Owners and Buyers

SIMPLE MARKETPLACE STATE TRANSITIONS

initially buyers can make offers
then
either an owner can accept an offer and the protocol stops
or the offer is rejected and the protocol restarts

2025-04-27

A Choreographic View of Smart Contracts

└ A nice sketch! [5, 6]

What did we just see?

A smart contract looks like

a choreographic model

global specifications determine the enabled actions along the evolution of the protocol

a typestate

In OOP, “can reflects how the legal operations on imperative objects can change at runtime as their internal state changes.” [2]

2025-04-27

A Choreographic View of Smart Contracts

└─What did we just see?

What did we just see?

A smart contract looks like

- choreographic model
global specifications determine the enabled actions along the evolution of the protocol
- typestate
In OOP, “can reflects how the legal operations on imperative objects can change at runtime as their internal state changes.” [2]

A new coordination model

So, we saw an interesting model where

distributed components coordinate through a global specification

which specifies which actions enabled along the computation

“without forcing” components to be cooperative!

2025-04-27

A Choreographic View of Smart Contracts

└ A new coordination model

A new coordination model

So, we saw an interesting model where

distributed components coordinate through a global specification

which specifies which actions enabled along the computation

“without forcing” components to be cooperative!

Let's look again at our sketch

SIMPLE MARKETPLACE STATE TRANSITIONS

- APPLICATION ROLES:
- OWNER (O)
 - BUYER (B)

- LEGEND
- TF: TRANSITION FUNCTION
 - AR: ALLOWED ROLE
 - AIR: ALLOWED INSTANCE ROLE
 - — A HAPPY PATH

2025-04-27

A Choreographic View of Smart Contracts

Let's look again at our sketch

Let's look again at our sketch

SIMPLE MARKETPLACE STATE TRANSITIONS

- APPLICATION ROLES:
- OWNER (O)
 - BUYER (B)

- LEGEND
- TF: TRANSITION FUNCTION
 - AR: ALLOWED ROLE
 - AIR: ALLOWED INSTANCE ROLE
 - — A HAPPY PATH

but...

- ✗ can buyers be owners too?
- ✗ what's the difference between roles and instances?
- ✗ what's the scope and and quantification?
- ✗ when are transitions enabled?
- ✗ how does the state of the contract change?

2025-04-27

A Choreographic View of Smart Contracts

Let's look again at our sketch

ok

ok

from [6]: “The transitions between the **Item Available** and the **Offer Placed** states can continue until the owner is satisfied with the offer made.” so, after a rejection, the new offer must be from the original buyer or a new one?

ok

should the price of the item remain unchanged when the owner invokes the Reject?

...and by the way

medium.com/@teamtech/formal-verification-of-smart-contracts-trust-in-the-making-2745a60ce9db

Bug-free programming is a difficult task and a fundamental challenge for critical systems. To this end, formal methods provide techniques to develop programs and certify their correctness.

FORMAL VERIFICATION OF SMART CONTRACTS

Last edit: @bskrksyp9 July 26, 2024 See contributors

Smart contracts are making it possible to create decentralized, trustless, and robust applications that introduce new use-cases and unlock value for users. Because smart contracts handle large amounts of value, security is a critical consideration for developers.

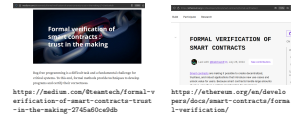

https://ethereum.org/en/developers/docs/smart-contracts/formal-verification/

We assume that sorts can be inferred; **TRAC** instead requires to assign sorts explicitly
Expressions are standard but for state variables occurring in rhs e must have the old $_$ qualifier; this concept will be used in the definition of (progress for) well-formedness
We adapt the mechanism based on the old keyword from the Eiffel language [4] which, as explained in [3] is necessary to render assignments into logical formulae since e.g., $x = x+1 \iff \text{False}$.

Data-Aware FSMs

A DAFSMs c on state variables u_1, \dots, u_n is a finite-state machine “instantiated” by a participant p whose transitions are decorated with specific labels as follows¹

2025-04-27

A Choreographic View of Smart Contracts

Data-Aware FSMs

γ predicates over state variables and formal parameters of its transition; guards have to be satisfied for the invocation to succeed: an invocation that makes the guard false is rejected

- $\nu p: R$ specifies that p must be a fresh participant with role R
- $\text{any } p: R$ qualifies p as an existing participant with role R
- p we refer to a participant in the scope of a binder
- invocations from non-suitable callers are rejected

the variables occurring in the right-hand side of assignments in B are either state variables or parameters of the invocation

Data-Aware FSMs

A DAFSMs c on state variables u_1, \dots, u_n is a finite-state machine “instantiated” by a participant p whose transitions are decorated with specific labels as follows¹

¹See [1, Def. 1]; here we just simplified the notation and adapted it to our needs

Save names' freeness, the other properties are undecidable in general, so we'll look for sufficient conditions on DAFSMs ensuring role non-emptiness and progress.

2025-04-27

A Choreographic View of Smart Contracts

└ Not all DAFSMs “make sense”

Not all DAFSMs “make sense”

The diagram shows three DAFSMs, each with a single state and a transition from an initial state to a final state. The first DAFSM is labeled 'names' freeness' and has the transition $\nu o: O \triangleright \text{start}(c)$ and $p \triangleright f()$. The second DAFSM is labeled 'role emptiness' and has the transition $\nu o: O \triangleright \text{start}(c)$ and $\text{any } p: R \triangleright f()$. The third DAFSM is labeled 'no progress' and has the transition $\nu o: O \triangleright \text{start}(c) \{u := 0\}$ and $\{u > 0\} \nu p: R \triangleright f()$.

Save names' freeness, the other properties are undecidable in general, so we'll look for sufficient conditions on DAFSMs ensuring role non-emptiness and progress.

Determinism

A DAFSM is deterministic if

where $_ \# _$ is the least binary symmetric relation s.t.

$\nu p: R \# \pi$ and $\nu p: R \# \text{any } p': R'$ and $R \neq R' \implies \text{any } p: R \# \text{any } p': R'$

2025-04-27

A Choreographic View of Smart Contracts

└ Determinism

transitions from the same source state and calling the same function

Determinism

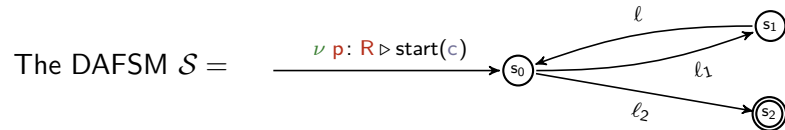

A DAFSM is deterministic if

whenever $\gamma_1 \wedge \gamma_2 \implies \pi_1 \# \pi_2$ then

where $_ \# _$ is the least binary symmetric relation s.t.

$\nu p: R \# \pi$ and $\nu p: R \# \text{any } p': R'$ and $R \neq R' \implies \text{any } p: R \# \text{any } p': R'$

Exercise: Determinism

is deterministic or not, depending on the labels l_1 and l_2 .

- 1 Is it the case that \mathcal{S} is not deterministic whenever $l_1 = l_2$?
- 2 Find two labels l_1 and l_2 that make \mathcal{S} deterministic
- 3 Find two labels $l_1 \neq l_2$ that make \mathcal{S} non-deterministic

2025-04-27

A Choreographic View of Smart Contracts

Exercise: Determinism

Exercise: Determinism

is deterministic or not, depending on the labels l_1 and l_2 .

- 1 Is it the case that \mathcal{S} is not deterministic whenever $l_1 = l_2$?
- 2 Find two labels l_1 and l_2 that make \mathcal{S} deterministic
- 3 Find two labels $l_1 \neq l_2$ that make \mathcal{S} non-deterministic

1. no: eg for $l_1 = l_2 = \nu p: R$ \mathcal{S} is deterministic
2. $l_1 = l_2 = \nu p: R \triangleright f(\dots, T_i x_i, \dots)$ make \mathcal{S} deterministic because the next state is unambiguously determined by the caller which is fresh on both transitions
3. $l_1 = \{x \leq 0\} p \triangleright f(x: \text{Int})$ and $l_2 = \{x \geq -1\} p \triangleright f(x: \text{Int})$ make \mathcal{S} non-deterministic because the guards of l_1 and of l_2 are not disjoint therefore the next state is not determined by the caller

Well-formedness

A DAFSM is well-formed when it is

empty-role free

consistent, and

deterministic

2025-04-27

Exercise: well-formedness

Which of the following DAFSM is well-formed?

2025-04-27

A Choreographic View of Smart Contracts

Exercise: well-formedness

yes: o is defined on paths it occurs on and the DAFSM is deterministic.

no: the transition from s_0 violates consistency since True does not imply $u > 0$ hinting that the protocol could get stuck in state s_1 . However, this never happens because u is initially set to 1 and never changed, hence the transition from s_1 would be enabled when the protocol lands in s_1 .

[A tool]

Verification

Checking well-formedness by hand is laborious and cumbersome

So we implemented **TRAC**, which

- ✓ **transforms** DAFSMs in a DSL to specify DAFSMs
- ✓ **verifies** well-formedness condition relying on the SMT solver Z3
- ✓ **it's efficient enough**
- ✗ but **cannot handle** roles and inter-contract interactions

Verification

Checking well-formedness by hand is laborious and cumbersome

So we implemented **TRAC**, which

- ✓ **transforms** DAFSMs in a DSL to specify DAFSMs
- ✓ **verifies** well-formedness condition relying on the SMT solver Z3
- ✓ **it's efficient enough**
- ✗ but **cannot handle** roles and inter-contract interactions

The architecture of TRAC

2025-04-27

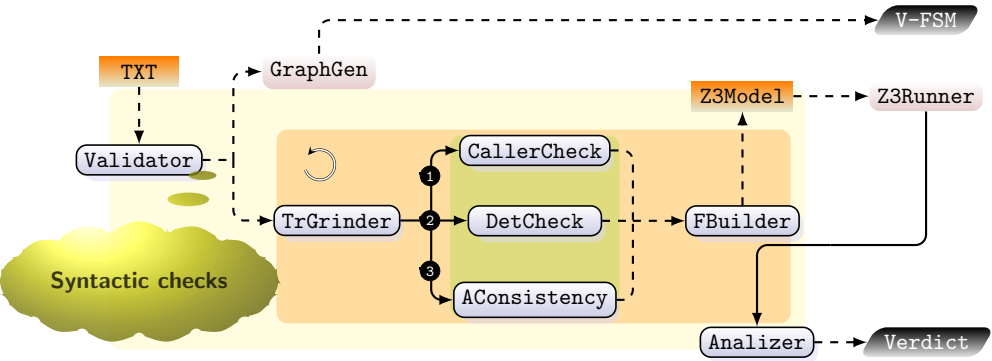

A Choreographic View of Smart Contracts

The architecture of TRAC

the architecture of **TRAC** is compartmentalised into two principal modules: parsing and visualisation (yellow box) and **TRAC**'s core (orange box). The latter module implements well-formedness check (green box). Solid arrows represent calls between components while dashed arrows data IO.

The architecture of TRAC

2025-04-27

A Choreographic View of Smart Contracts

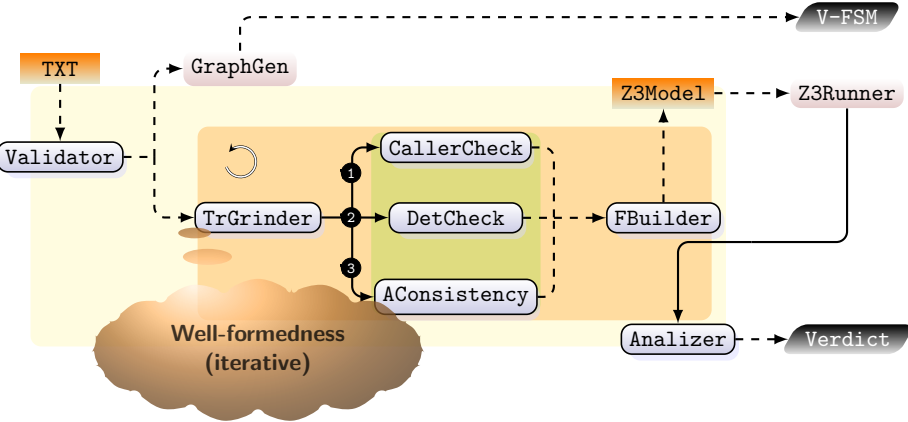

The architecture of TRAC

basic syntactic checks on a DSL representation of DAFSMs and transforming the input in a format that simplifies the analysis of the following phases:

- passed to GraphGen for visual representation of DAFSMs (V-FSM output)
- passed to the TrGrinder component (orange box) for well-formedness checking.

The architecture of TRAC

A Choreographic View of Smart Contracts

The architecture of TRAC

AConsistency (arrow 3) to generate a Z3 formula which holds if, and only if, the transtion is consistent.

The architecture of TRAC

2025-04-27

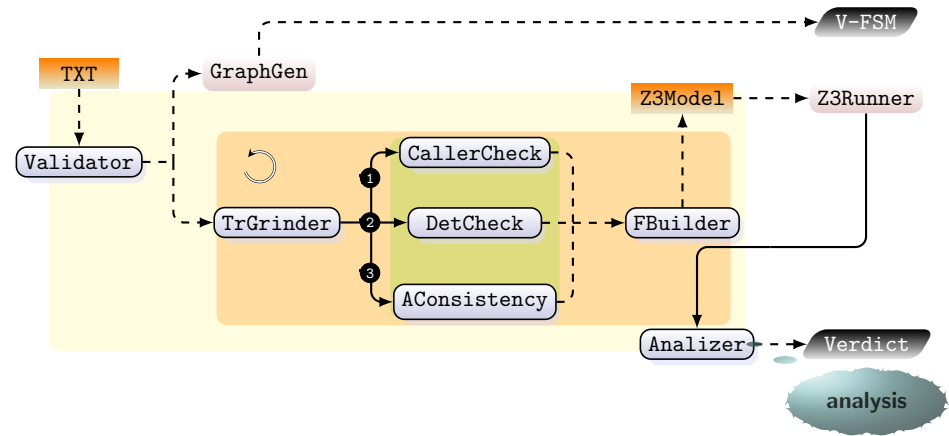

A Choreographic View of Smart Contracts

The architecture of TRAC

computes the z3 f.la equivalent to the conjunction of the outputs which is then passed to a Z3 engine to check its satisfiability

The architecture of TRAC

2025-04-27

A Choreographic View of Smart Contracts

The architecture of TRAC

Finally, the Analyzer component that diagnoses the output of Z3 and produces a Verdict which reports (if any) the violations of well-formedness of the DAFSM in input.

Installation

Detailed instructions at <https://github.com/loctet/TRAC>

Dependencies: Java RE (to render DAFSM graphically) & Python 3.6 or later

```
$ pip install z3-solver matplotlib networkx
```
